Bound for Las Vegas: where clean air moves forward

In an era of unprecedented demand, the clean energy industry is converging in the US this September to accelerate innovation, forge powerful partnerships and chart the course for a smarter, more resilient grid.

Taking place from 8th to 11th September, 2025, at The Venetian Expo & Caesars FORUM, RE+ 25 is North America's largest and most comprehensive clean energy event. In 2024, it welcomed more than 40,000 attendees and 1,350 exhibitors from around the world, creating a powerful platform for showcasing solutions, building partnerships and catalyzing innovation.

What began as Solar Power International (SPI) has grown into something more: a convergence of energy sectors that includes solar, energy storage, EV infrastructure, wind, hydrogen and microgrids. As the industry's flagship event, RE+ now represents not just the technologies of the clean energy transition, but a vital platform to address tomorrow's energy demand.

What sets this event apart is its backing by its two leading parent organizations, the Solar Energy Industries Association (SEIA) and the Smart Electric Power Alliance (SEPA). It's not just about showcasing what's happening now; it's about discussing what comes next. This is where clean energy's top minds gather to share insights, tackle challenges and accelerate meaningful business opportunities.

This year's General Session is billed as 'RE+ On Air', a live, podcast-style general session hosted by Molly Wood, Founder and CEO of Molly Wood Media, a climate solutions media company, and host of 'Everybody in the Pool', a podcast for the climate economy.

Molly is a former writer and broadcaster at CNET/CBS, the New York Times and host on the radio program Marketplace. Now, she invests, connects and educates on all things climate tech. She'll serve as the attendees' guide, setting the stage for RE+ 25, a week designed to equip you and your network with

the insights, education and networking you need to accelerate our industry.

From there, the event unfolds into four days of immersive learning, business opportunities, networking and exploration. Whether you're seeking solutions for your company, technical knowledge, market insights, policy updates or simply face time with colleagues and clients, there is something for every corner of the clean energy economy.

Full Conference Passholders will gain exclusive access to eight concurrent education tracks, the Main Stage, and for the first time in 2025, the Full Conference Lounge, a comfortable retreat onsite for private conversations, a moment to recharge, or catching up on emails over coffee. It's just one example of how it is refining the attendee experience to balance both action and reflection.

The educational content this year reflects the full scope of issues driving and challenging the clean energy transition. Topics include regulatory reform and utility engagement, transmission and interconnection, cybersecurity risks, long-duration storage, hydrogen development, community engagement and ESG and workforce strategies. Tracks are designed to appeal across job functions, from technical experts and engineers to project developers, installers, manufacturers, executives and policymakers.

Session formats are as varied as the content itself. Attendees can choose from panels, Energy Exchanges, QuickTalks, Deep Dives and RE+ Tech sessions. Whether you prefer a deep technical dive, a collaborative brainstorming session or a quick hit of insights, the flexibility of content makes it possible to learn on your terms.

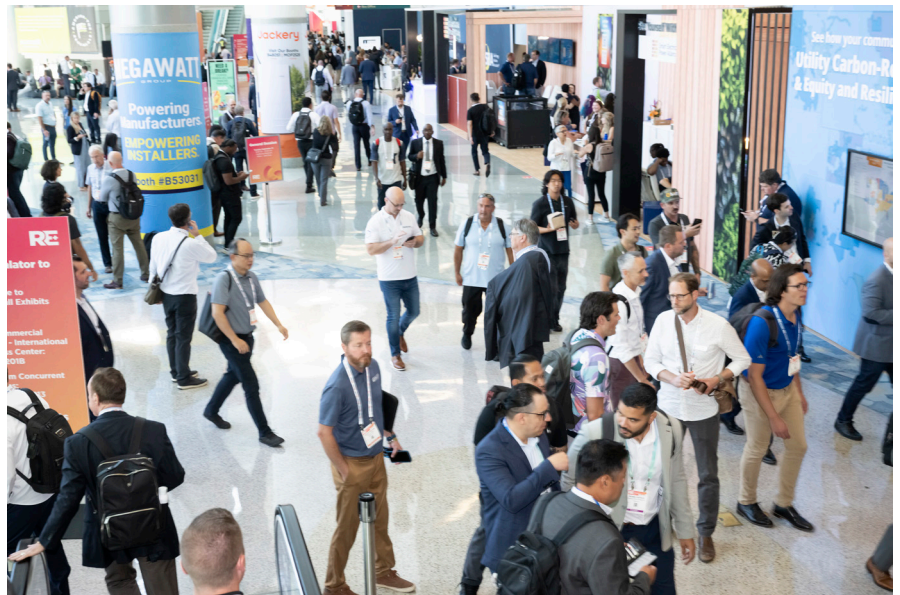

And this year, the event is making Monday more valuable than ever. For the first time, a Monday Deep Dive Education Pass provides access to programming for professionals with limited availability. Monday Deep Dives, will focus on business-critical topics like sales, cybersecurity, workforce development and communications, offering a focused start to the week's programming for those looking to zero in on key business challenges.

Adding to the depth of the experience, the conference includes two days of hands-on workshops on Monday and Thursday, designed for attendees seeking advanced instruction and real-world application. These workshops require an additional ticket and cover everything from microgrid deployment and grid integration to PV policy, permitting and system operations.

While much of the focus is on the US market, the event's global perspective continues to grow. In 2025, it will proudly feature Denmark as the Spotlight Country, co-hosted by Danish Energy Export.

Denmark is widely regarded as a clean energy pioneer, having built world-leading offshore wind capacity and made major advances in hydrogen infrastructure, district heating, and grid modernization. With a national goal of achieving 100% renewable electricity by 2030 and climate neutrality by 2050, Denmark exemplifies the kind of cross-sector ambition this event exists to promote.

And while the educational programming is essential, the heart of RE+ 25 remains its massive expo hall, where more than 1,300 companies will showcase the latest in clean energy technology, equipment, software and services. From innovative solar tracking systems and advanced batteries to drones and robotics, EV charging networks and

resource management systems, the show floor is a powerful reflection of the industry's value and ingenuity.

It's also where informal conversation sparks formal collaboration. A coffee meeting becomes a joint venture. A booth visit turns into a multi-state project. For many companies, the deals and partnerships formed here define the year ahead.

This is what makes it so essential: its ability to bring together every piece of the clean energy puzzle in one place, at one moment, when the need for collaboration and resilience is undeniable. In a time when meeting energy demand depends not just on good ideas but on scalable, coordinated action, RE+ 25 offers a platform for the entire industry to align, inspire and execute.

With tens of thousands of attendees expected again in 2025, the event continues to grow in reach, relevance and impact. Whether you're building the next great startup, managing a utility-scale deployment, navigating policy complexity or rethinking workforce culture, you'll find the expertise, insight and partnerships you need.

Clean energy is no longer a single sector; it's essential for meeting tomorrow's energy demand and this is where it comes together.

This September, join thousands of your peers in Las Vegas for a week that could define the next era of your work, your company and our shared energy future.
