

If renewable energy is to dominate the energy system by 2030, it will be the result of cutting-edge technologies, services and market development. To explore how we might achieve all this, RenewableUK is running a webinar series – Future Systems 2021 – and you are invited!

Supported by strategic partners ScottishPower Renewables and Burges Salmon LLP , sessions will be presented by industry experts and will offer a chance for you to interact and ask your own questions. There will be unparalleled networking opportunities with everyone from grid specialists and stakeholders, to trade and professional associations, developers, manufacturers, planners and press in attendance.

Among the subjects to be discussed will be the strategy for hydrogen, the flexibility of systems to optimise output, the 2030's Power Park and the potential of hybrid sites, and the development of storage markets to support the journey to net zero. Discuss exclusive case studies, gain invaluable business intelligence and review cutting-edge technology designed to combat intermittency and deliver grid resilience.
